

Open lift - 180° exit

Dignified access to all buildings

The new open lift from BC lift is a concept in development. The idea is to create a circular lifting platform. A circular cabin offers a number of advantages over existing systems.

A circular cabin has many advantages. The doors do not occupy any extra space; the curved doors slide within the lift car walls; the round shape is aesthetically pleasing and sends many positive signals compared to a square shape.

Open lift with rotation

Get off to the left or right - you decide

Sometimes it is difficult, within an existing building, to find a suitable location in which to place a lift.

This open lift offers the possibility of exiting in an alternative direction to that of entry making it extremely versatile.

The lift is able to rotate through 90 degrees, which significantly increases the number of possible locations for the lift.
